

Know What You Need

Lockout Machine Inventory Assessment

Identifying the equipment in your facility that requires lockout tagout is the first step in creating an effective lockout program and procedures. However, time and resource constraints and changes within a facility, such as new equipment additions or updates to machinery and manufacturing lines, make it difficult to keep your lockout equipment list up-to-date.

Save both time and resources and let our safety team help you jump start the process. Our team helps you create, update and standardize your lockout equipment list to include items such as the equipment ID number, type of machine and the number of lockout points.

Once completed, this lockout equipment list provides a high-level asset overview that you can maintain in-house as your facility changes, helping you meet and maintain OSHA compliance requirements (such as the creation of machine-specific lockout procedures).

Process

- We first work with your team to understand the amount of equipment under the project scope
- After clearly defining your needs, we come on-site to collect your equipment data
- Once the data collection is complete, we create your lockout equipment list in a standardized format and present you with your new lockout inventory spreadsheet
- This spreadsheet can be easily imported into our LINK360® software to help you create your visual lockout procedures and more

Your equipment list can include:

- Site name
- Area name
- Equipment name
- Equipment ID #
- Equipment location
- Equipment type
