

Asset and Inventory Tracking Simplified

CenSys Integrated RFID Reader

CenSys Integrated RFID Reader

Asset and Inventory Tracking Simplified

As a streamlined, easy-to-install and cost-effective solution, the CenSys reader offers ultra-high frequency (UHF) RFID asset tracking that's accessible to a broader range of applications and markets. It's designed as a low bandwidth device, enabling large deployments of readers to be managed from the cloud. The CenSys reader may also work as an IoT (Internet of Things) device, delivering asset location and sensor information to aid in machine learning and larger aggregated data analytic applications.

The CenSys Difference

CenSys is not a traditional UHF RFID reader. Although it can perform the same functions and offers many of the same benefits as a traditional reader, it also removes the complexity of the data infrastructure installation, custom software and integrations. The CenSys reader also accommodates cloud deployments and configurable alerts at the device level, all from one easy-to-operate mobile and cloud-hosted software solution.

Traditional RFID Readers	CenSys Integrated RFID Reader
Requires RFID expertise to install	Simple, user-friendly installation
Costly infrastructure (data, power and antennas)	Lower cost solution with no cables (data or power) necessary
Processing of information performed in software	Programmable internal logic with human interfaces on device (LED and audio notifications available)
Acts as an input only	Two-way software communication and field notifications

Product Features

Streamlined Asset Tracking

- Fully-integrated RFID reader
- Detects presence/location of assets with RFID tags
- Low bandwidth for improved tracking accuracy

Adaptable for Tracking Applications

- Adaptive antenna tuning, with expandability up to 4 antennas
- Two-way software communication
- MQTT ready for IoT connectivity
- Local or cloud hosting capabilities

Easy Installation

- Wi-Fi connected
- Multiple power supply options: USB, 5V, 24V
- No complex wiring

CenSys Software

Brady's CenSys Software is web-based with an app for mobile devices that allows users to see the location of their assets in real time. It's specifically designed to provide an intuitive and simple asset tracking experience for the user.

On the dashboard, users can quickly and easily:

- Search for assets
- View asset location history
- View asset velocity of most and least active assets
- View the status of assets checked out to different departments
- View a user-specific list of "favorite" assets
- View asset picture and characteristics
- Set up e-mail and text message notifications
- Configure audible and visual field alerts
- Run reports
